Objectives

- Describe the current research data management climate
- Outline good data management practices and standards
- Provide resources that can assist in meeting data management needs and requirements

“a scholar’s positive contribution is measured by the sum of the original data that he contributes. Hypotheses come and go but data remain. Theories desert us, while data defend us. They are our true resources, our real estate, and our best pedigree. In the eternal shifting of things, only they will save us from the ravages of time and from the forgetfulness or injustice of men.”

(Santiago Ramón y Cajal, 1897)

Current Research Data Management Climate

- Federal and foundation funders
- Publishers
- Focus on Rigor and
Reproducibility

Article References Citing Articles (3) Metrics

The International Committee of Medical Journal Editors (ICMJE) believes that there is an ethical obligation to responsibly share data generated by interventional clinical trials because participants have put themselves at risk. In a growing consensus, many funders around the world — foundations, government agencies, and industry — now mandate data sharing. Here we outline the ICMJE's proposed requirements to help meet this obligation. We encourage feedback on the proposed requirements. Anyone can provide feedback at www.icmje.org by 18 April 2016.

The ICMJE defines a clinical trial as any research project that prospectively assigns people or a group of people to an intervention, with or without concurrent comparison or control groups, to study the cause-and-effect relationship between a health-related intervention and a health outcome. Further details may be found in the *Recommendations for the Conduct, Reporting, Editing and Publication of Scholarly Work in Medical Journals* at www.icmje.org.

As a condition of consideration for publication of a clinical trial report in our member journals, the ICMJE proposes to require authors to share with others the deidentified individual-patient data (IPD) underlying the results presented in the article (including tables, figures, and appendices or supplementary material) no later than 6 months after publication. The data underlying the results are defined as the IPD required to reproduce the article's findings, including necessary metadata. This requirement will go into effect for clinical trials that begin to enroll participants beginning 1 year after the ICMJE adopts its data-sharing requirements. (The ICMJE plans to adopt data-sharing requirements after considering feedback received to the proposals made here.)

Perspective

Toward Fairness in Data Sharing

The International Consortium of Investigators for Fairness in Trial Data Sharing
N Engl J Med 2016; 375:405-407 | August 4, 2016 | DOI: 10.1056/NEJMp1605654

Comments open through August 10, 2016

Article References Citing Articles (1) Comments (16) Metrics

The International Committee of Medical Journal Editors (ICMJE) has proposed a plan for sharing data from randomized, controlled trials (RCTs) that will require, as a condition of acceptance of trial results for publication, that authors make publicly available the deidentified individual patient data underlying the analyses reported in an article.¹ Before any data-sharing policy is enacted, we believe there is a need for the ICMJE, trialists, and other stakeholders to discuss the potential benefits, risks, and opportunity costs, as well as whether the same goals can be achieved by simpler means. Although we believe there are potential benefits to sharing data (e.g., occasional new discoveries), we believe there are also risks (e.g., misleading or inaccurate analyses and analyses aimed at unfairly discrediting or undermining the original publication) and opportunity costs (e.g., the ICMJE proposal would have enormous direct costs and would probably divert resources, both financial and human, from the actual conduct of trials). In 2010 alone, results of more than 27,000 RCTs were published.² We believe consideration needs to be given to whether it is worthwhile to undertake data sharing for all published trials or just for those whose results are under

Publisher Requirements

<https://www.statnews.com/2017/06/06/data-sharing-rules-disappoint/>

Publisher Requirements

- As of 1 July 2018 manuscripts submitted to ICMJE journals that report the results of clinical trials must contain a data sharing statement
- Clinical trials that begin enrolling participants on or after 1 January 2019 must include a data sharing plan in the trial's registration. If the data sharing plan changes after registration this should be reflected in the statement submitted and published with the manuscript, and updated in the registry record.

Rigor and Reproducibility

- **New guidelines for grants started January 25, 2016**
 - Scientific premise must describe strengths/weaknesses of prior research
 - Scientific rigor to ensure robust/unbiased experimental design, methodology, analysis, interpretation, reporting of results
 - Consideration of relevant biological variables
 - Authentication of key biological/chemical resources

Rigor and Reproducibility

- **New guidelines for grants started January 25, 2016**

- Scientific premise must describe strengths/weaknesses of prior research
- Scientific rigor to ensure robust/unbiased experimental design, methodology, analysis, interpretation, reporting of results

- **Full transparency in reporting experimental details**

- Consideration of relevant biological variables
 - Authentication of key biological/chemical resources

outnumbered by the hundreds of thousands published each year in good faith.

“a complex array of other factors seems to have contributed to the **lack of reproducibility**. Factors include poor training of researchers in experimental design; increased emphasis on making provocative statements rather than presenting technical details; and **publications that do not report basic elements of experimental design**”

NIH plans to enhance reproducibility

Francis S. Collins and **Lawrence A. Tabak** discuss initiatives that the US National Institutes of Health is exploring to restore the self-correcting nature of preclinical research.

A growing chorus of concern, from scientists and laypeople, contends that the complex system for ensuring

shorter term, however, the checks and balances that once ensured scientific fidelity have been hobbled. This has compromised

in such journals, including promotion and tenure, and in extreme circumstances, cash rewards⁶.

Then there is the problem of what is not published. There are few venues for researchers to publish negative data or papers that point out scientific flaws in previously published work. Further compounding the problem is the difficulty of accessing unpublished data — and the failure of funding agencies to establish or enforce policies that insist on data access.

PRECLINICAL PROBLEMS

Reproducibility is potentially a problem in all scientific disciplines. However, human clinical trials seem to be less at risk because they are already governed by various regulations that stipulate rigorous design and independent oversight — including randomization, blinding, power estimates, pre-registration of outcome measures in standardized, public databases such as ClinicalTrials.gov and oversight by institutional review boards and data safety monitoring boards. Furthermore, the clinical trials community has taken important steps towards adopting standard reporting elements⁷.

Principles and Guidelines for Reporting Preclinical Research

Joint workshop June 2014: NIH, NPG, Science

Consensus from journal editors:

- Rigorous statistical analysis
- **Transparency in reporting**
- **Data and material sharing**
- Consideration of refutations
- Consider establishing best practice guidelines for:
 - Image based data
 - Antibodies
 - Cell lines
 - Animals

Tracking retractions as

Leading diabetes researcher acted negligently, probe concludes

with 2 comments

Several duplications in the work of a prominent diabetes researcher were the result of negligence, but there is not enough evidence to support charges of misconduct, according to an investigation at her university in Germany.

Recently, we've reported on several notices for papers co-authored by [Kathrin Maedler](#), a researcher at the University of Bremen. So far, Maedler has [one retraction](#), multiple [corrections](#), and [two expressions of concern](#) to her name, after several of her papers were [questioned on PubPeer](#). Previously, the University of Zurich in Switzerland — where Maedler completed her PhD in 2002 — determined there was a [lack of evidence to support](#) allegations of misconduct in papers that were part of her doctoral thesis.

Kathrin Maedler

Last week, the University of Bremen released its own investigation

“had published duplicate pictures in several cases and had repeatedly failed to exert due diligence in organising her area of study over a long period of time.”

- Who manages the entire process?

Workflows: In the weeds

- How, when and who will do the work?
- Will data be reviewed for quality?
- Who manages the entire process?

Who is responsible for data management?

Who is responsible for data management?

Everyone!

(but everyone means no one)

Quality Control

Assign a person to be responsible for ensuring:

- ✓ Naming conventions adhered to
- ✓ Minimum documentation
- ✓ Version controls followed
- ✓ Data backed up

Storage

Storage @ ECU

- PirateDrive
- Dataverse—for final datasets
- For information about where to store sensitive data:
<https://datagovernance.ecu.edu/sensitive-data-storage-and-transmission/>

Cloud Storage

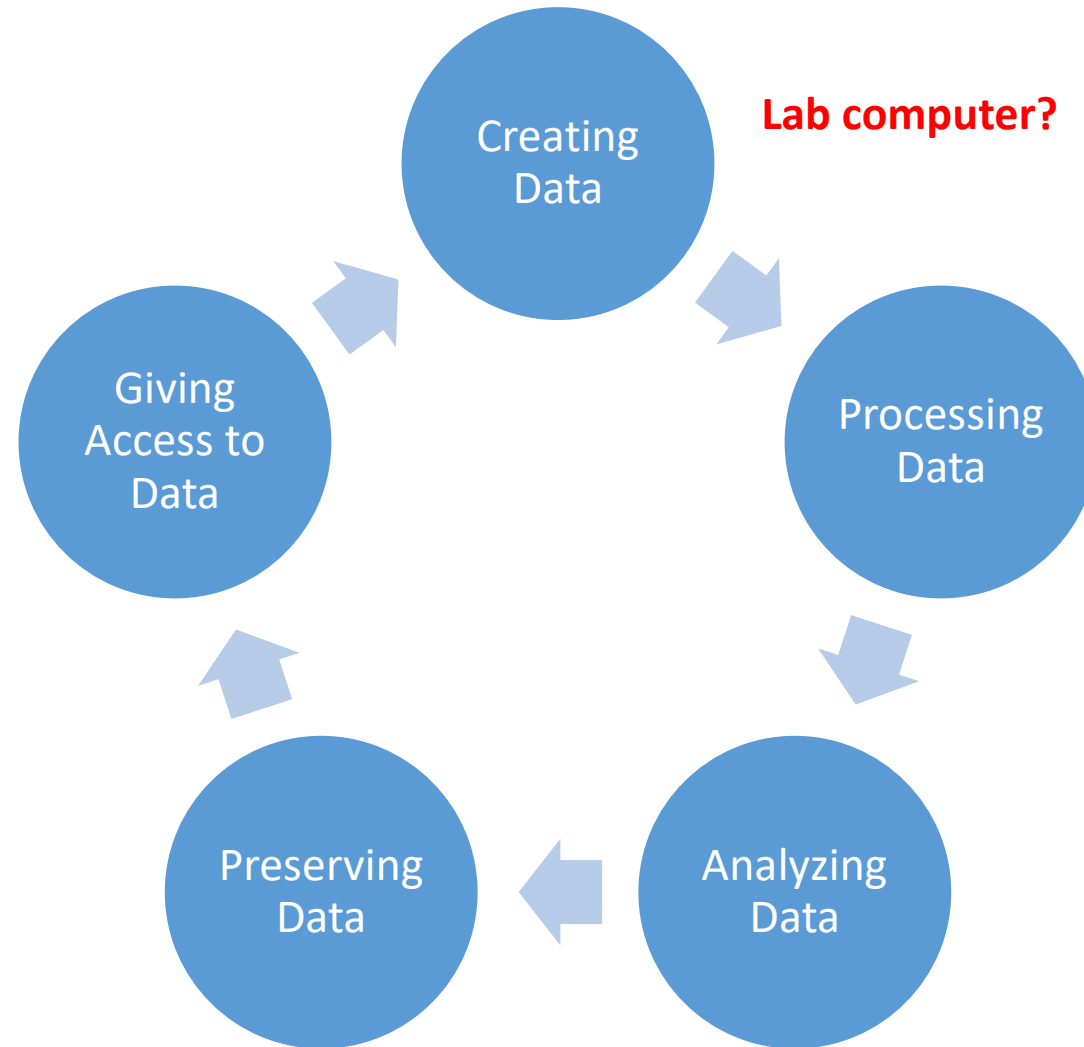

If you are going to use cloud storage:

- Check ownership policies
- Pick >1 provider

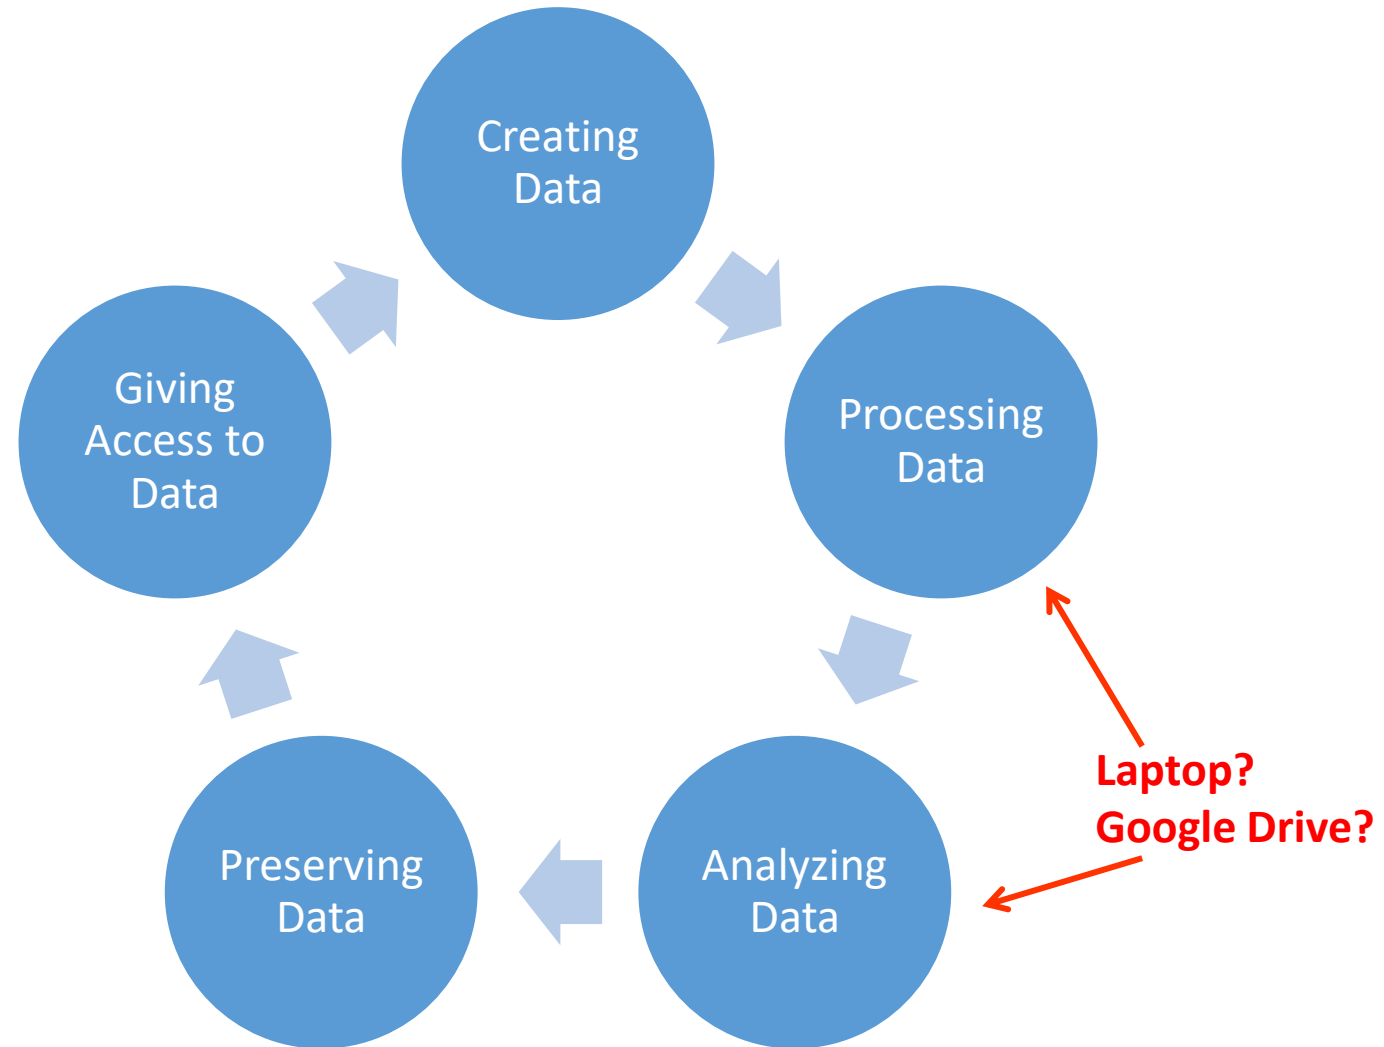

Where is data stored in different parts of the workflow?

Security Considerations: HIPAA

Preservation

storage ≠ preservation

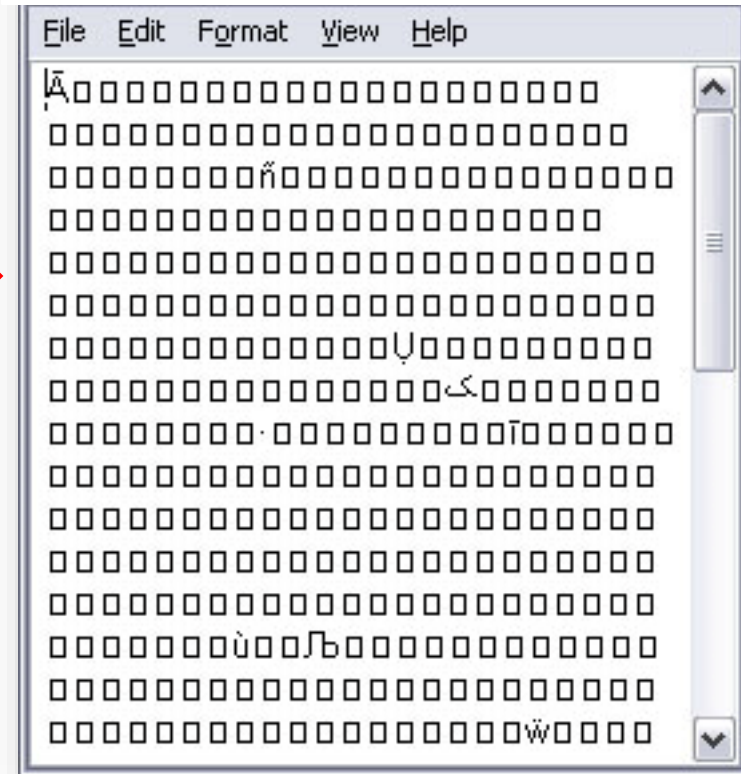

Preservation

Protects from: **Hardware obsolescence**

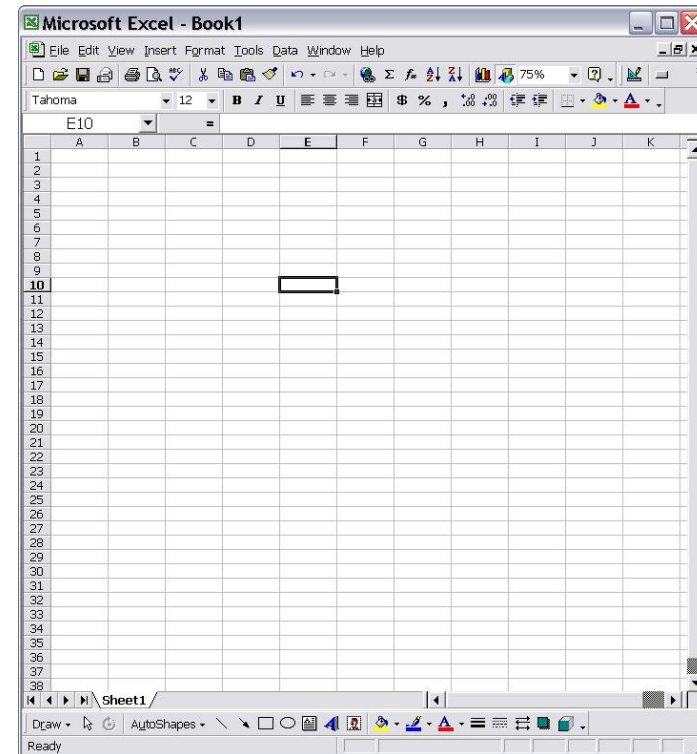

Preservation

Protects from: **Software obsolescence**

Preservation

Collection vs Dissemination

Preservation

Data Formats

Encryption and Compression

Data Ownership

Can't assume you own your data

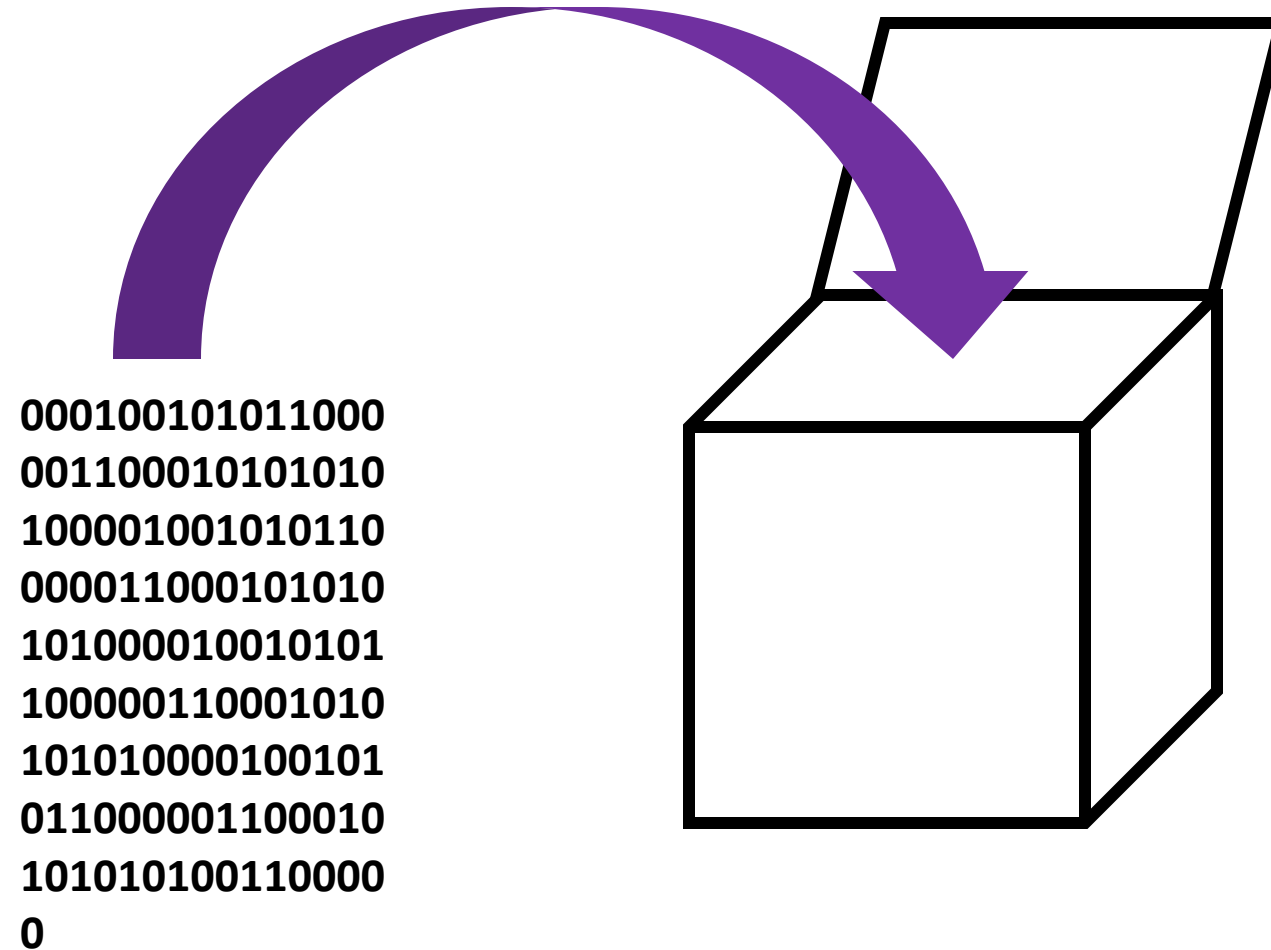

Check for:

- Funder policies on data ownership
- Institution policies on data ownership

Providing Access

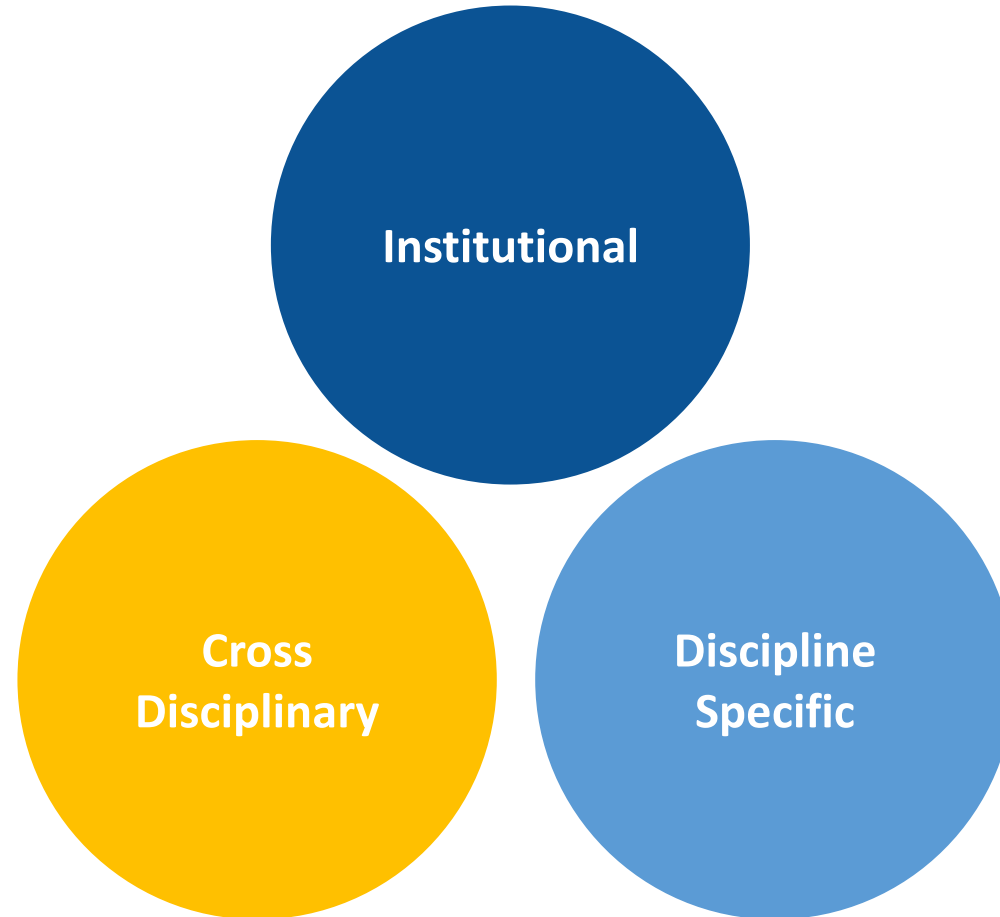

What is a repository?

Storage vs. Preservation vs. Access

Repository Types

NIH Data Sharing Repositories

NIH Data Sharing Repositories

This table lists NIH-supported data repositories that accept submissions of appropriate data from NIH-funded investigators (and others). Also included are resources that aggregate information about biomedical data and information sharing systems. The table can be sorted according by name and by NIH Institute or Center and may be searched using keywords so that you can find repositories more relevant to your data. Links are provided to information about submitting data to and accessing data from the listed repositories. Additional information about the repositories and points-of-contact for further information or inquiries can be found on the websites of the individual repositories.

Show entries

Search:

IC	Repository Name	Repository Description	Data Submission Policy	Access to Data
NCI	The Cancer Imaging Archive (TCIA)	The Cancer Imaging Archive (TCIA) is a large archive of medical images of cancer accessible for public download. All images are stored in DICOM file format. The images are organized as "Collections", typically patients related by a common disease (e.g. lung cancer), image modality (MRI, CT, etc) or research focus.	How to Submit Data to TCIA	How to Access TCIA Data
NCI (NHGRI, NIGMS)	PeptideAtlas	PeptideAtlas is a multi-organism, publicly accessible compendium of peptides identified in a large set of tandem mass spectrometry proteomics experiments. Mass spectrometer output files are collected for human, mouse, yeast, and several other organisms, and searched using the latest search engines and protein sequences.	How to Submit Data to PeptideAtlas	How to Access PeptideAtlas Data
NHGRI	FlyBase: A Drosophila Genomic and Genetic Database	Drosophila Genomic and Genetic database that includes proteomics data, microarrays and Tiling BAC's.	How to Submit Data to FlyBase	How to Access FlyBase Data
NHGRI	The Zebrafish Model Organism Database (ZFIN)	ZFIN serves as the zebrafish model organism database. It aims to: a) be the community database resource for the laboratory use of zebrafish, b) develop and support integrated zebrafish genetic, genomic and developmental information, c) maintain the definitive reference data sets of zebrafish research information, d) to link this information extensively to corresponding data in other model organism and human databases, e) facilitate the use of zebrafish as a model for human biology, and f) serve the needs of the research community.	How to Submit Data to ZFIN	How to Access ZFIN Data
NHGRI	WormBase	WormBase is an international consortium of biologists and computer scientists dedicated to providing the research community with accurate, current, accessible information concerning the genetics, genomics and biology of <i>C. elegans</i> and related nematodes.	How to Submit Data to WormBase	How to Access WormBase Data

Research Data Repositories

The screenshot shows the re3data.org website. At the top left is the logo "re3data.org" with the tagline "REGISTRY OF RESEARCH DATA REPOSITORIES". A black navigation bar contains links for Home, Search, Browse, Suggest, FAQ, About, Schema, Contact, and Imprint. Below this is a search section titled "Search for Repositories (1132 Reviewed Repositories)". It features a search input field and a blue "Search" button. Underneath are three dropdown menus for "Subject", "Content Type", and "Country (of the responsible institutions)". The "Subject" dropdown is open, showing "Basic Biological and Medical Rese...". Below the dropdowns are three checkboxes: "Certificates" (checked), "Open Access" (unchecked), and "Persistent Identifier" (unchecked). A red "Clear" button is located at the bottom right of the filter section.

Research Data Repositories

Figshare

The screenshot displays the Figshare user interface. At the top, the Figshare logo is on the left, and the user's name 'K. Read' is on the right. A search bar is located in the top center. Below the navigation tabs, there is a storage usage indicator showing '0% of private storage used' and another search bar for 'my data'. The main content area is a table of datasets with columns for selection, actions, type, date, status, and statistics.

Perspective

Avoiding Data Dumpsters — Toward Equitable and Useful Data Sharing

Laura Merson, Oumar Gaye, M.D., Ph.D., and Philippe J. Guerin, M.D., Ph.D.
N Engl J Med 2016; 374:2414-2415 | June 23, 2016 | DOI: 10.1056/NEJMp1605148

“One of the risks posed by these expanding repositories is the production of **“data dumpsters”**: repositories of data without the metadata, data dictionaries, or documentation needed for **meaningful** or correct reanalysis.”

What are data standards?

Data standards define:

- what to collect
- how to represent the data
- a vocabulary to use
- how to communicate the data

National Institutes
of Health

DMP Tool: Templates

DMP Tool

New template: NIH Genomic Data Sharing

The National Institutes of Health issued new [Guidance for Investigators in Developing Genomic Data Sharing Plans](#) along with some helpful sample plans (dated July 14, 2015). The DMPTool team has been monitoring the responses to the OSTP memo by federal agencies, but this alert came to us via the DMP admin email list. Please continue to let us know when you hear anything at all (see the links from a previous post "[How you Can Help](#)")!

We added a National Institutes of Health drop-down list to the DMPTool that contains the new NIH-GDS: Genomic Data Sharing template in addition to the NIH-GEN: Generic template. The basic data management requirements for most NIH grants remain unchanged (pending further notice); researchers can continue to use the generic template for most grants.

The new guidance pertains to those proposing research that will generate large-scale human and non-human genomic data. It describes the type of information that should be provided in a genomic data sharing plan and when the plan should be submitted, including instructions for IRB review, appropriate uses of the data, and suggested/required data repositories. The new guidance is an update to the existing [NIH GDS Policy](#) that became effective on January 25, 2015.

Open Science Framework

<https://osf.io/>

The screenshot displays the Open Science Framework (OSF) interface for a project titled "NYU Demo". The interface is organized into several sections:

- Header:** "Open Science Framework" logo and navigation links: "My Dashboard", "Browse", "Help", and a search bar. The user "Alisa Surkis" is logged in.
- Project Info:** "Contributors: Kevin Read, Alisa Surkis", "Date created: 2016-02-25 02:21 PM | Last Updated: 2016-02-25 03:27 PM", "Category: Project", "Description: No description", and "License: No license".
- Wiki:** Contains the text "Does political leaning correlate with how disaffected a voter is?", "Data source: national election survey 2012", and "Variables: libcpre_self, efflc_saystd; efflc_carestd".
- Files:** A tree view showing the project structure:
 - Project: NYU Demo
 - OSF Storage
 - Component: Data

Entity-based_schema MetadataDocumentation

Show rows with cells including:

Metadata Schema	Unnamed: 2	Unnamed: 3
Entity	Field	Definition
Dataset	Unique ID	automatically generated number
	Title	title of the dataset
	Alternate Title	alternate titles including acronyms
	Description	brief description of the nature and contents of the dataset
	Internal or External Dataset	distinction of whether dataset is external or internal
	Date added to the catalog	date that the dataset was added to catalog YYYY-MM-DD
	Date last updated in catalog	date that the dataset was most recently changed YYYY-MM-DD
	Date archived	date dataset is unpublished from catalog YYYY-MM-DD
	Start Date	dataset coverage start date YYYY-MM-DD
	End Date	dataset coverage end date: YYYY-MM-DD
	Data Accession Number	accession number provided to the dataset in the place where is it held, archi...
	Dataset format	format of dataset (e.g. txt, csv)
	Standards	standards used to create the variable or measurements. (e.g. CDISC)
	Dataset size	total size of dataset(s)
	Geographic coverage	geographic location covered by dataset
	Domain	subject domain of dataset
	Keywords	descriptors of dataset content
	Population age	age categories covered by dataset
	Population gender	genders covered by dataset
	Study Type	type of study (e.g. observational, interventional)
	Data Type	type of data (e.g. electrophysiological, behavioral)
	Related dataset(s)	unique IDs from other dataset records within the catalog

GitHub

The screenshot shows a GitHub repository page for 'evildmp / VirtualMicroscope'. At the top, there are navigation links for 'Code', 'Issues 3', 'Pull requests 4', 'Pulse', and 'Graphs'. Below this, it states 'No description or website provided.' and shows repository statistics: 14 commits, 3 branches, 0 releases, and 2 contributors. A toolbar includes a branch selector set to 'master', a 'New pull request' button, and options for 'New file', 'Find file', 'HTTPS', and a download ZIP button. A commit history table lists recent changes, with the most recent being 'evildmp fixed indentation error' on May 2, 2013. Below the table is a 'README.md' section with the following content:

VirtualMicroscope

This application was created by the NYU School of Medicine Division of Educational Informatics: William Holloway and Marc Triola MD. The Virtual Microscope uses the Google Maps API to display, annotate, and navigate scanned slides. The working NYU site is available here: <http://cloud.med.nyu.edu/virtualmicroscope/>

This project consists of two components:

- A Python script to convert slide files obtained by scanners from Aperio and Bacus Labs into a format compatible with the Google Maps API.
- An example viewer upon which you can base your local instance

Installation

1. Set up your development machine with Python, MySQL, Python Imaging Library, and Django (now requires version 1.4 or greater). Django Guides: [Django Quick install guide](#) [Django - Deploying to a production web server](#)
2. Create a Django Project for your local instance.
3. In that project, install both Version 2 of the NYUVM and [Django Compressor](#) (now required for performance reasons). This involves:
 - Copying the app folders into the project
